Chemical Kinetics Practice Problems And Answers Chemical Kinetics Practice Problems and Answers Mastering the Rate of Reactions Chemical kinetics is the study of reaction rates and reaction mechanisms Its a fascinating field that delves into the intricate dance of molecules as they transform from reactants to products Understanding chemical kinetics is crucial for a wide range of applications from designing efficient catalysts to predicting the stability of materials This article aims to provide a comprehensive set of practice problems and solutions designed to help you solidify your understanding of chemical kinetics Well cover essential concepts like rate laws integrated rate laws activation energy and reaction mechanisms along with examples that illustrate their applications

1 Rate Laws and Rate Constants The rate law for a reaction describes the relationship between the rate of reaction and the concentration of reactants For example the general rate law for a reaction  $A + B \rightarrow C$  can be written as  $\text{Rate} = k[A]^m[B]^n$  Where Rate The rate of the reaction  $k$  The rate constant a proportionality constant specific to the reaction at a given temperature  $A$  and  $B$  The concentrations of reactants  $A$  and  $B$   $m$  and  $n$  The reaction orders with respect to  $A$  and  $B$  respectively which are determined experimentally

Practice Problem 1 The following data were collected for the reaction  $2A + B \rightarrow C$

Experiment	A (M)	B (M)	Initial Rate (Ms <sup>-1</sup> )
1	0.10	0.10	0.050
2	0.20	0.10	0.200
3	0.10	0.20	0.100

Determine the rate law for the reaction and calculate the rate constant

Solution 1 Determine the order with respect to  $A$  Compare experiments 1 and 2 where  $B$  is constant but  $A$  doubles The rate quadruples indicating a secondorder dependence on  $A$   $2^2 = 4$  2 Determine the order with respect to  $B$  Compare experiments 1 and 3 where  $A$  is constant but  $B$  doubles The rate doubles indicating a firstorder dependence on  $B$  3 Write the rate law  $\text{Rate} = k[A]^2[B]$  4 Calculate the rate constant Using data from any experiment we can solve for  $k$   $0.050 \text{ Ms}^{-1} = k(0.10 \text{ M})^2(0.10 \text{ M})$   $k = 5.0 \text{ M}^{-2} \text{ s}^{-1}$

2 Integrated Rate Laws Integrated rate laws relate the concentration of reactants to time The form of the integrated rate law depends on the order of the reaction For a firstorder reaction Integrated rate law  $\ln A_t = \ln A_0 - kt$  Halflife  $t_{1/2} = 0.693/k$  For a secondorder reaction Integrated rate law  $1/A_t = 1/A_0 + kt$  Halflife  $t_{1/2} = 1/kA_0$

Practice Problem 2 The decomposition of  $N_2O_5$  is a firstorder reaction with a rate constant of  $6.8 \times 10^{-3} \text{ s}^{-1}$  at a certain temperature a Calculate the halflife of the reaction b If the initial concentration of  $N_2O_5$  is  $0.50 \text{ M}$  what will be the concentration after 2 minutes

Solution 3 a Halflife  $t_{1/2} = 0.693/k = 0.693 / 6.8 \times 10^{-3} \text{ s}^{-1} = 101.6 \text{ s}$  b Concentration after 2 minutes First convert 2 minutes to seconds 2 minutes  $\times 60 \text{ seconds/minute} = 120 \text{ seconds}$   $\ln N_2O_5_t = \ln N_2O_5_0 - kt$   $\ln N_2O_5_t = \ln 0.50 \text{ M} - 6.8 \times 10^{-3} \text{ s}^{-1} \times 120 \text{ s}$   $\ln N_2O_5_t = 0.816$   $\ln 0.50 \text{ M} = 0.693$   $\ln N_2O_5_t = 0.693 - 0.816 = -0.123$   $N_2O_5_t = e^{-0.123} = 0.884 \text{ M}$

3 Activation Energy and the Arrhenius Equation The activation energy  $E_a$  is the minimum amount of energy required for reactants to overcome the energy barrier and form products The Arrhenius equation relates the rate constant  $k$  to the activation energy and temperature  $T$   $k = A e^{-E_a/RT}$  Where  $A$  The preexponential factor which is related to the frequency of collisions between molecules  $R$  The ideal gas constant  $8.314 \text{ J/molK}$

Practice Problem 3 The rate

constant for a reaction is  $1.2 \times 10^2 \text{ s}^{-1}$  at  $25^\circ\text{C}$ . The activation energy is  $50 \text{ kJmol}^{-1}$ . Calculate the rate constant at  $45^\circ\text{C}$ .  
**Solution:** First convert temperatures to Kelvin.  $T_1 = 25^\circ\text{C} = 273.15 + 25 = 298.15 \text{ K}$ .  $T_2 = 45^\circ\text{C} = 273.15 + 45 = 318.15 \text{ K}$ . Use the Arrhenius equation in the form  $\ln k_2/k_1 = E_a/R (1/T_1 - 1/T_2)$ .  
 $\ln(1.2 \times 10^2 / k_2) = 50,000 \text{ Jmol}^{-1} / 8.314 \text{ Jmol}^{-1}\text{K}^{-1} (1/298.15 - 1/318.15)$   
 $\ln(1.2 \times 10^2 / k_2) = 0.693 / 4$   
 $1.2 \times 10^2 / k_2 = e^{0.693/4} = 1.175$   
 $k_2 = 1.2 \times 10^2 / 1.175 = 1.02 \times 10^2 \text{ s}^{-1}$

**4 Reaction Mechanisms** A reaction mechanism is a stepbystep description of how a reaction proceeds. Each step involves a single molecular event called an elementary reaction.  
**Practice Problem 4** The following mechanism has been proposed for the reaction  $2\text{NO} + \text{O}_2 \rightarrow 2\text{NO}_2$ .  
 Step 1:  $2\text{NO} + \text{N}_2\text{O}_2 \rightarrow \text{fast}$   
 Step 2:  $\text{N}_2\text{O}_2 + \text{O}_2 \rightarrow 2\text{NO}_2$  (slow)  
 a) Identify the ratedetermining step.  
 b) Derive the rate law for the overall reaction.  
**Solution:** a) Ratedetermining step: The slow step in a reaction mechanism is the ratedetermining step as it determines the overall rate of the reaction. In this case, Step 2 is the rate determining step.  
 b) Rate law: The rate law for the overall reaction is based on the ratedetermining step:  $\text{Rate} = k_2[\text{N}_2\text{O}_2][\text{O}_2]$ . However,  $\text{N}_2\text{O}_2$  is an intermediate and its concentration cannot be measured directly. We need to express  $\text{N}_2\text{O}_2$  in terms of reactants using the equilibrium constant for the fast step:  $K_1 = \frac{[\text{N}_2\text{O}_2]}{[\text{NO}]^2}$ . Substitute this back into the rate law:  $\text{Rate} = k_2 K_1 [\text{NO}]^2 [\text{O}_2]$ . Where  $k = k_2 K_1$ .

**Key Takeaways:** Chemical kinetics deals with the rate and mechanism of chemical reactions. Rate laws describe how the rate of a reaction depends on reactant concentrations. Integrated rate laws relate reactant concentration to time. Activation energy is the minimum energy required for a reaction to occur.

**5 Reaction mechanisms** provide a detailed description of how a reaction proceeds stepbystep. Further Practice: To further enhance your understanding of chemical kinetics, explore additional practice problems from textbooks and online resources. Focus on understanding the concepts behind each problem and applying the appropriate equations. Remember, chemical kinetics is a vast field with numerous applications. By mastering the fundamental principles, you'll be well-equipped to tackle realworld problems and contribute to scientific advancements.
