in this book we study decision trees for fault diagnosis in circuits and switching networks which are among the most fundamental models for computing boolean functions we consider two main cases when the scheme circuit or switching network has the same mode of operation for both calculation and diagnostics and when the scheme has two modes of operation normal for calculation and special for diagnostics in the former case we get mostly negative results including superpolynomial lower bounds on the minimum depth of diagnostic decision trees depending on scheme complexity and the np hardness of construction diagnostic decision trees in the latter case we describe classes of schemes and types of faults for which decision trees can

be effectively used to diagnose schemes when they are transformed into so called iteration free schemes the tools and results discussed in this book help to understand both the possibilities and challenges of using decision trees to diagnose faults in various schemes the book is useful to specialists both in the field of theoretical and technical diagnostics it can also be used for the creation of courses for graduate students
